Amendments to the Claims:

The listing of claims will replace all prior versions and listings of claims in the application:

Listing of Claims:

1 (currently amended): A method for determining whether a communication device is permitted to access communication service in a communication network, the communication device comprising:

a data memory capable of storing ciphertext access information; and

an inerasable memory capable of storing a deciphering key in a non-volatile way; and

the method comprising:

enciphering access information corresponding to the communication device into the ciphertext access information using a predetermined cryptography algorithm according to an enciphering key stored outside of the communication device, wherein the enciphering key corresponds to the deciphering key, and wherein the communication network comprises a service provider capable of providing communication service to the communication device; there being a database in the service provider for recording the enciphering key corresponding to the communication device; and

recording the ciphertext access information in the data memory;

reading the deciphering key in the inerasable memory and the ciphertext access information in the data memory; and

deciphering the ciphertext access information to plaintext access information according to the deciphering key by using ~~a predetermined~~ the cryptography algorithm, and

determining whether the communication device is permitted to access communication service in the communication network accordingly.

2 (original): The method of claim 1 wherein the cryptography algorithm is an asymmetric encryption-and-decryption algorithm.

3 (original): The method of claim 1 wherein the data memory is a non-volatile memory.

4 (cancelled)

5 (currently amended): The method of ~~claim 4~~ claim 1 further comprising:

generating the enciphering key and the corresponding deciphering key according to the cryptography algorithm before generating the ciphertext access information according to the enciphering key.

6 (cancelled)

7 (currently amended): The method of ~~claim 6~~ claim 1, wherein when generating the ciphertext access information according to the enciphering key, the service provider enciphers the access information corresponding to the communication device to generate the ciphertext access information according to the enciphering key stored in the database.

8 (original): The method of claim 7, wherein when recording the ciphertext access information in the data memory, transmitting the ciphertext access information from the service provider to the communication device via the communication network, and recording the ciphertext access information in the data memory with the communication

device.

9 (currently amended): The method of ~~claim 4~~ claim 1, wherein the enciphering key is different from the deciphering key.

10 (original): The method of claim 1, wherein when determining whether the communication device is permitted to access communication service of the communication network according to the plaintext access information, determining whether the plaintext access information conforms to predetermined access information; the communication device being determined permitted to access the communication service of the communication network if the plaintext access information conforms to the predetermined access information.

11 (original): The method of claim 1 in which the communication device further comprises a subscriber identification module card (SIM card) capable of recording a subscriber identification number, and a predetermined identification number is recorded in the plaintext access information, wherein when determining whether the communication device is permitted to access communication service in the communication network according to the plaintext access information, determining whether the subscriber identification code conforms to the predetermined identification code; the communication device being permitted to access the communication service if the predetermined identification code and the subscriber identification code correspond to each other, and the communication device being not permitted to access the communication service and having access to the communication network stopped if the predetermined identification code and the subscriber identification code do not correspond to each other.

12 (currently amended): A communication device utilized in a communication network for accessing communication service of the communication network; the communication device comprising:

a data memory capable of storing ciphertext access information in a non-volatile way;

an inerasable memory capable of storing a deciphering key in a non-volatile way; and

a processor capable of controlling operation of the communication device;

wherein before the communication device accesses the communication service of the communication network, the processor reads the deciphering key in the inerasable memory and the ciphertext access information in the data memory, utilizes a predetermined cryptography algorithm to decipher the ciphertext access information to plaintext access information according to the deciphering key, and determines whether the communication device is permitted to access communication service of the communication network according to plaintext access information;

wherein the communication network comprises a service provider for providing communication service to the communication device; there being a database in the service provider capable of recording an enciphering key corresponding to the communication device, the enciphering key being stored outside of the communication device; the ciphertext access information being generated by enciphering the access information corresponding to the communication device by the cryptography algorithm according to the enciphering key, wherein the enciphering key corresponds to the deciphering key.

13 (original): The communication device of claim 12 wherein the cryptography algorithm is an asymmetric encryption-and-decryption algorithm.

14 (cancelled)

15 (currently amended): The communication device of ~~claim 14~~ claim 12 wherein the enciphering key and the corresponding deciphering key are generated according to the cryptography algorithm.

16 (currently amended): The communication device of ~~claim 14~~ claim 12 wherein the ciphertext access information is transmitted from the service provider to the communication device via the communication network, and recorded in the data memory by the communication device.

17 (original): The communication device of claim 12 wherein when the processor determines whether the communication device is permitted to access communication service according to the plaintext access information, the processor determines whether the plaintext access information conforms to predetermined access information; wherein the processor determining the communication device is permitted to access the communication service if the plaintext access information conforms to the predetermined access information.

18 (original): The communication device of claim 12 in which the communication device further comprises a SIM card capable of recording a subscriber identification number, and a predetermined identification code is recorded in the plaintext access information, wherein when the processor determines whether the communication device is permitted to access communication service according to the plaintext access information, the processor determines whether the subscriber identification code conforms to the predetermined

identification code; the communication device being permitted to access the communication service if the predetermined identification code and the subscriber identification code correspond to each other, and the communication device being not permitted to access the communication service and access to the communication network being stopped if the predetermined identification code and the subscriber identification code do not correspond to each other.

19 (original): The communication device of claim 12 in which the communication device is a cell phone, and the communication network is a wireless communication network.

20 (currently amended): A method applied in a communication network, wherein the communication network comprises a plurality of communication devices and each communication device comprises an inerasable memory and a data memory; the method being capable of determining whether each communication device is permitted to access communication service of the communication network; the method comprising:

providing a plurality of different enciphering keys and a plurality of deciphering keys according to a cryptography algorithm, wherein each enciphering key corresponds to each deciphering key, wherein the communication network further comprises a service provider capable of transmitting signals and providing communication service among communication devices, service provider having a database storing enciphering keys corresponding to each communication device in the database, the enciphering keys being stored outside of the respective communication devices;

providing different corresponding enciphering keys to different communication devices;

enciphering access information corresponding to each

communication device to ciphertext access information by the cryptography algorithm according to the enciphering key corresponding to the communication device;

storing deciphering keys corresponding to the enciphering keys corresponding to each of the communication devices in the inerasable memory;

storing ciphertext access information of each communication device in the data memory of the communication device; and

when determining whether a communication device is permitted to access the communication service, deciphering the ciphertext access information in the data memory by the cryptography algorithm according to the enciphering key stored in the inerasable memory, and determining whether the communication device is permitted to access the communication service according to the deciphered ciphertext access information.

21 (original): The method of claim 20, wherein the deciphering keys corresponding to different enciphering keys are different.

22 (original): The method of claim 20, wherein the cryptography algorithm is an asymmetric encryption-and-decryption algorithm such that an enciphering key is not equal to the corresponding deciphering key, and when a plaintext is enciphered into a ciphertext according to the enciphering key by the cryptography algorithm, the cryptography algorithm cannot decipher the ciphertext into the original plaintext according to the enciphering key.

23 (cancelled)

24 (original): The method of claim 20 in which the communication device is a cell phone, and the communication network is a wireless communication network.
